

# Building Fictional Compounds

- Each different item you have represents a different new "element" (oxygen, hydrogen).
  - Put these different elements together to build a "compound" (water).
    - Build your compound. Sketch it out.
    - Give your new compound a name.
1. How many different **types** elements are in your compound?
  2. How many different **types** of atoms are in your compound?
  3. What is your new compound used for?
